Grocery App Report

1. Introduction

Overview

This is an androidapp that helps you to make a list ofgrocery items along with its price and quantity.

Purpose

We are humans and we cannot remember everything. Wesometimes forget the things that we want to buy. However,with the assistance of this app you can make a list of grocery items you intend to buy so that you don't forget anything and also have a track of your expenditure forbudget maintenance.

2. Literature Survey.

Existing Problem

Users frequently forget items to buy because of which they have to run to shops again and again which is quite a frustrating and tiring situation and if our expenses crosses out budget while shopping that could be a matter

of concern.

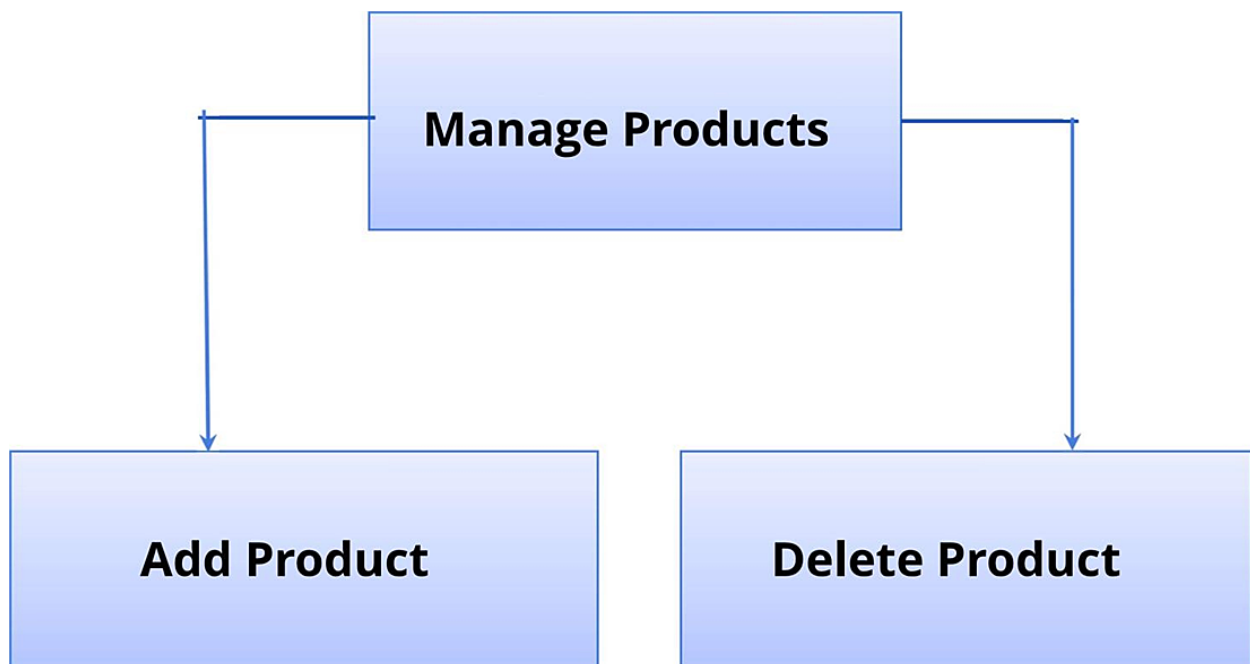

Proposed Solution

To overcome this problematic situation I built a groceryapp which helps you to list down all the item that you need to buy along with its price.

4.Experimental Investigations

In this project MVVM (Model View ViewModel) was

used for architectural patterns, Room for database, Coroutines and RecyclerView to display the list of items.

LiveData: A data holder class that can be observed. Always holds/caches the latest version of data, and notifies its observers when data has changed. LiveData is lifecycle aware. UI components just observe relevant data and don't stop or resume observation. LiveData automatically manages all of this since it's aware of the relevant lifecycle status changes while observing.

Smart Internz

ViewModel: Acts as a communication center between the Repository (data) and the UI. The UI no longer needs to worry about the origin of the data. ViewModel instances survive Activity/Fragment recreation.

Repository: A class that you create that is primarily used to manage multiple data sources.

Entity: Annotated class that describes a database table when working with Room.

Room database: Simplifies database work and serves as an access point to the underlying SQLite database (hides SQLiteOpenHelper). The Room database uses the DAO to issue queries to the SQLite database.

SQLite database: On device storage. The Room persistence library creates and maintains this database for you.

DAO: Data access object. A mapping of SQL queries to functions. When you use a DAO, you call the

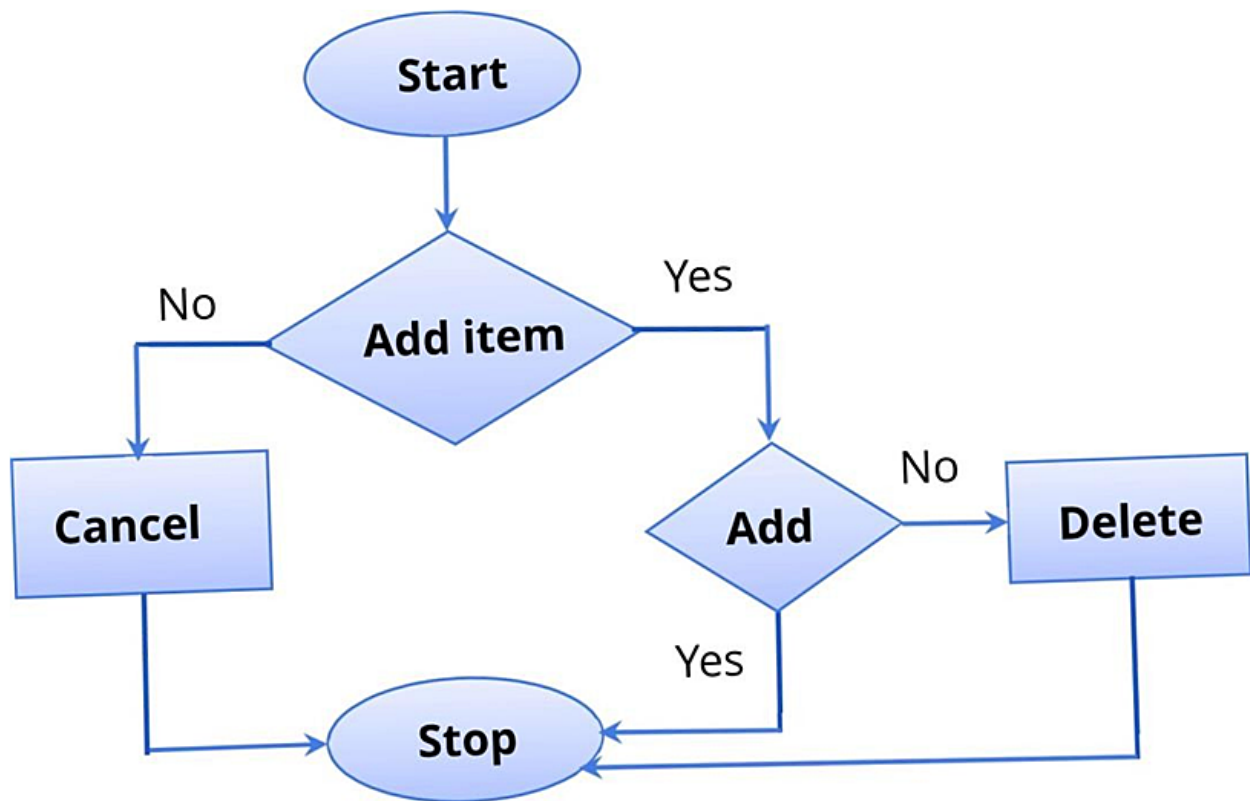

methods, and Room takes care of the rest.

RecyclerView: It is a container and is used to display the collection of data in a large amount of dataset that can be scrolled very effectively by maintaining a limited number of views.

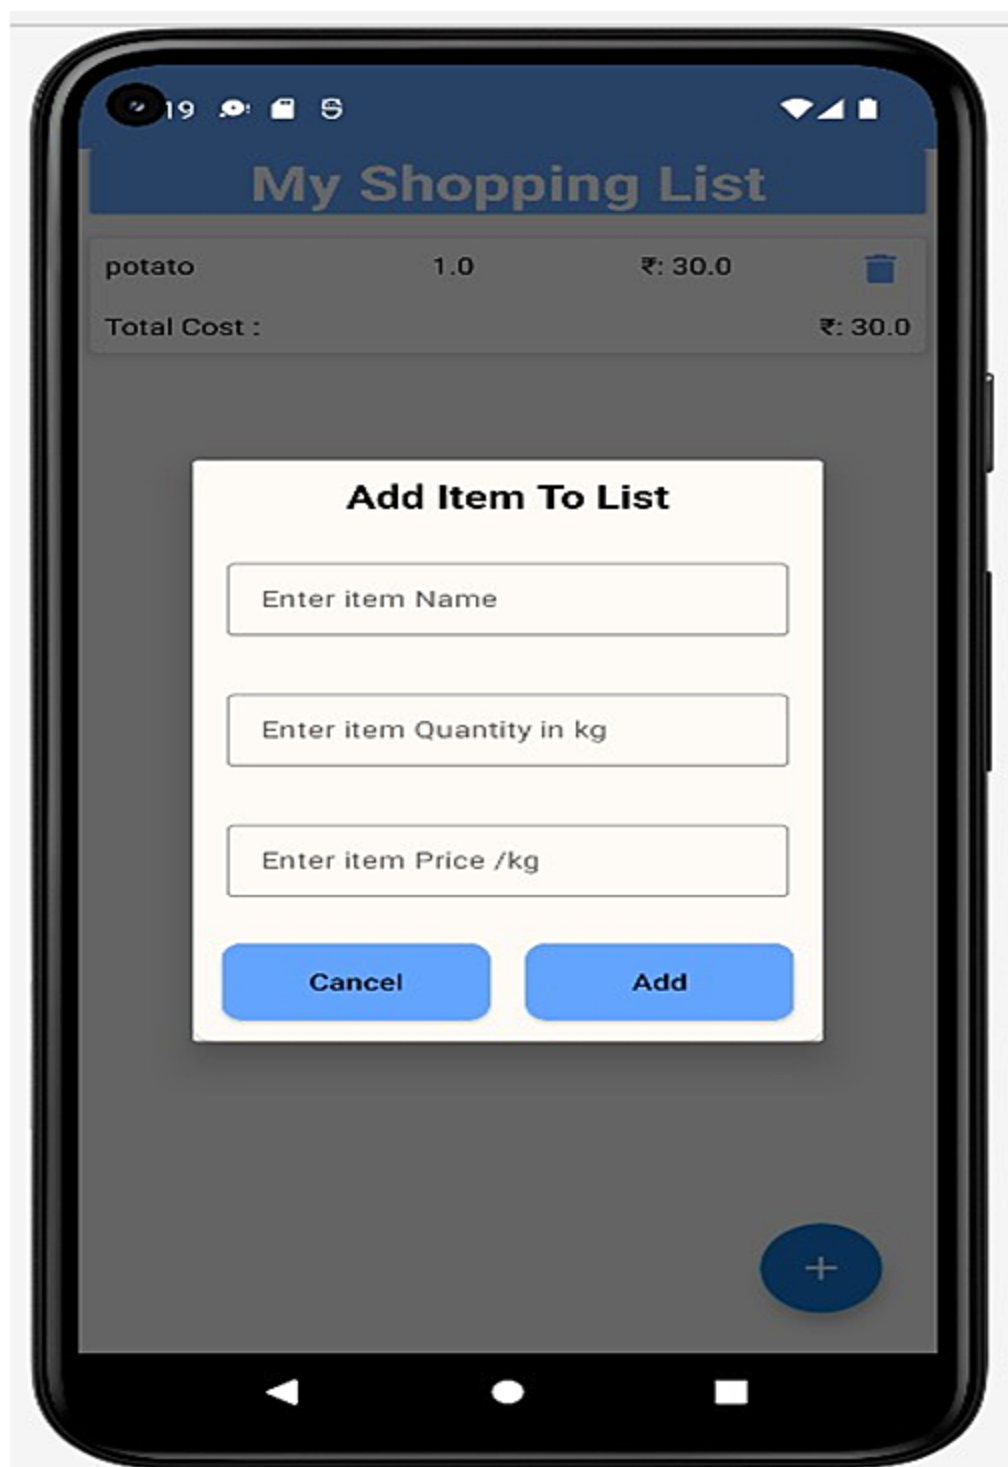

Coroutines: Coroutines are lightweight threads, we use a coroutine to perform an operation on other threads, by this our main thread doesn't block and our app doesn't crash.

7.Conclusion

This project helped me to clear my concepts on Room Database, Coroutines, MVVM, etc. This project would help me not just as a developer to learn new and interesting things but also as a user we generally

forgets items to purchase while shopping. Working on this project made me confident enough to apply my knowledge on android app development and create such an app. I have used Kotlin to build this application. All the functionality is coded in the classes and interfaces created and the layout is designed using xml.
